Cabin Crew

Flight attendants or cabin crew (also known as stewards/stewardesses, air hosts/hostesses) are members of an aircrew employed by airlines primarily to ensure the safety and comfort of passengers aboard commercial flights on select business jet aircraft, and on some military aircraft.

History

The role of a flight attendant derives from that of similar positions on passenger ships or passenger trains, but it has more direct involvement with passengers because of the confined quarters and often longer travel times on aircraft. Additionally, the job of a flight attendant revolves around safety to a much greater extent than those of similar staff on other forms of transportation. Flight attendants on board a flight collectively form a cabin crew, as distinguished from pilots and engineers in the cockpit.

Heinrich Kubis was Germany's (and the world's) first flight attendant, in 1912.

Origins of the word "steward" in transportation are reflected in the term "chief steward" as used in maritime transport terminology. The term purser and chief steward are often used interchangeably describing personnel with similar duties among seafaring occupations. This lingual derivation results from the international British maritime tradition (i.e. chief mate) dating back to the 14th century and the civilian United States Merchant Marine on which US aviation is somewhat modeled. Due to international conventions and agreements, in which all ships' personnel who sail internationally are similarly documented by their respective countries, the U.S. Merchant Marine assigns such duties to the chief steward in the overall rank and command structure of which purser are not positionally represented or rostered.

Imperial Airways of the United Kingdom had "cabin boys" or "stewards"; in the 1920s. In the USA, Stout Airways was the first to employ
stewards in 1926, working on Ford Trimotor planes between Detroit and Grand Rapid, Michigan. Western Airlines (1928) and Pan American World Airways (Pan Am) (1929) were the first US carriers to employ stewards to serve food. Ten-passenger Fokker aircraft used in the Caribbean had stewards in the era of gambling trips to Havana, Cuba from Key West, Florida. Lead flight attendants would in many instances also perform the role of purser, steward, or chief steward in modern aviation terminology.

The first female flight attendant was a 25-year-old registered nurse named Ellen Church. Hired by United Airlines in 1930, she also first envisioned nurses on aircraft. Other airlines followed suit, hiring nurses to serve as flight attendants, then called "stewardesses" or "air hostesses", on most of their flights. In the United States, the job was one of only a few in the 1930s to permit women, which, coupled with The Great Depression, led to large numbers of applicants for the few positions available. Two thousand women applied for just 43 positions offered by Transcontinental and Western Airlines in December 1935.

Female flight attendants rapidly replaced male ones, and by 1936, they had all but taken over the role. They were selected not only for their knowledge but also for their characteristics. A 1936 New York Times article described the requirements: "The girls who qualify for hostesses must be petite; weight 100 to 118 pounds; height 5 feet to 5 feet 4 inches; age 20 to 26 years. Add to that the rigid physical examination each must undergo four times every year, and you are assured of the bloom that goes with perfect health."

Three decades later, a 1966 New York Times classified ad for stewardesses at Eastern Airlines listed these requirements: "A high school graduate, single (widows and divorcees with no children considered), 20 years of age (girls 19 1/2 may apply for future consideration). 5’2” but no more than 5’9,” weight 105 to 135 in proportion to height and have at least 20/40 vision without glasses."

In the United States, they were required to be unmarried and were fired if they decided to wed. The requirement to be a registered nurse on an American airline was relaxed as more women were hired, and it disappeared almost entirely during World War II as many nurses enlisted in the armed forces.
Overview

The primary role of a flight attendant is to ensure passenger safety. In addition to this, flight attendants are often tasked with customer service duties such as serving meals and drinks, as a secondary responsibility.

The numbers of flight attendants required on flights are mandated by international safety regulations. For planes with up to 19 passenger seats, no flight attendant is needed. For larger planes, one flight attendant per 50 passenger seats is needed.

The majority of flight attendants for most airlines are female, though a substantial number of males have entered the industry since the 1970s.

Responsibilities

Prior to each flight, flight attendants attend a safety briefing with the pilots and lead flight attendant. During this briefing they go over safety and emergency checklists, the locations and amounts of emergency equipment and other features specific to that aircraft type. Boarding particulars are verified, such as special needs passengers, small children traveling as unaccompanied or VIPs. Weather conditions are discussed including anticipated turbulence. Prior to each flight a safety check is conducted to ensure all equipment such as life-vests, torches (flashlights) and firefighting equipment are on board, in the right quantity, and in proper condition. Any unserviceable or missing items must be reported and rectified prior to takeoff. They must monitor the cabin for any unusual smells or situations. They assist with the loading of carry-on baggage, checking for weight, size and dangerous goods. They make sure those sitting in emergency exit rows are willing and able to assist in an evacuation and move those who are not willing or able out of the row into another seat. They then must do a safety demonstration or monitor passengers as they watch a safety video. They then must "secure the cabin" ensuring tray tables are stowed, seats are in their upright positions, armrests down and carry-on stowed correctly and seat belts are fastened prior to takeoff. All the service between boarding and take-off is called Pre Take off Service.

Once up in the air, flight attendants will usually serve drinks and/or food to passengers. When not performing customer service duties, flight attendants must periodically conduct cabin checks and listen for any unusual noises or situations. Checks must also be done on the lavatory to ensure the smoke detector hasn't been deactivated and to restock supplies.
as needed. Regular cockpit checks must be done to ensure the pilot's health and safety. They must also respond to call lights dealing with special requests. During turbulence, flight attendants must ensure the cabin is secure. Prior to landing all loose items, trays and rubbish must be collected and secured along with service and galley equipment. All hot liquids must be disposed of. A final cabin check must then be completed prior to landing. It is vital that flight attendants remain aware as the majority of emergencies occur during takeoff and landing. Upon landing, flight attendants must remain stationed at exits and monitor the airplane and cabin as passengers disembark the plane. They also assist any special needs passengers and small children off the airplane and escort children, while following the proper paperwork and ID process to escort them to the designated person picking them up.

Flight attendants are trained to deal with a wide variety of emergencies, and are trained in First Aid. More frequent situations may include a bleeding nose, illness, small injuries, intoxicated passengers, aggressive and anxiety stricken passengers. Emergency training includes rejected takeoffs, emergency landings, cardiac and in-flight medical situations, smoke in the cabin, fires, depressurization, on-board births and deaths, dangerous goods and spills in the cabin, emergency evacuations, hijackings, water landings, and sea, jungle, arctic, and desert survival skills.

**Training**

Flight attendants are normally trained in the hub or headquarters city of an airline over a period that may run from four weeks to six months, depending on the country and airline. The main focus of training is safety. Safety training includes, but is not limited to: emergency passenger evacuation management, use of evacuation slides/life rafts, in-flight firefighting, and survival in the jungle, sea, desert, ice, first aid, CPR, defibrillation, ditching/emergency landing procedures, decompression emergencies, Crew Resource Management and security.

In the United States the Federal Aviation Administration requires flight attendants on aircraft with 20 or more seats to hold a *Certificate of Demonstrated Proficiency*. This is not considered to be the equivalent of an airman certificate (license), although it is issued on the same card stock. It shows that a level of required training has been met. It is not limited to the airline at which the attendant is employed (although some initial documents showed where the holder was working), and is the attendant's personal
property. It does have two ratings, called Group I and II. Either or both of these may be earned depending upon the type of aircraft (propeller or turbofan) on which the holder has trained.

**Work Environment**

Because airlines operate around the clock, flight attendants work evenings, weekends, and holidays. Attendants may be away from home two to three nights per week. Most have variable schedules.

**Cabin Crew Lifestyle**

A cabin crew’s lifestyle is different from most, as the demands of the profession are different from most other job. Maintaining good health can be a challenge for a member of the cabin crew if you don’t think about planning for it in advance. By leading a **healthy lifestyle** on the daily basis, you can ensure that your health is at its best while performing the duties of your job. In order to build good daily health routines, you should be aware of the benefits of **nutrition and exercise**.

**Adapting to Lifestyle Changes**

The nature of the cabin crew profession, with its scheduled hours and destinations, requires considerable adaptation on the part of cabin crew. These changes can have direct effect on your current lifestyle. The changes include schedule, personal life, relocation, and loneliness.

- **Schedule**
  The airlines operate around the clock and the cabin crew have to work in shifts that involve irregular hours, working weekends and public holidays, and spending time away from home. The hours in a flight attendant's working day are irregular and are determined by the flight assignment. If the flight leaves at 5 A.M., the flight attendant is expected to report to the captain by 4 A.M. The maximum number of flying hours per day is also set by union agreement, and on-duty time is usually limited to 12 hours per day, with a daily maximum of 14 hours.

- **Personal Life**
  The month-to-month schedule is never guaranteed for not to be changed, the cabin crew must be able to adjust their personal life accordingly. They may be flying weekends one month and the next month they might have a different series of days off. They may be gone for a day, or up to 6 to 8 days, or longer. Being away from home for what might be an
unknown periods of time can be the stressful job that they have to deal with.

- **Relocation**

  Another reality the cabin crew may face is the relocation to a base or domicile which is not presently your home. The decisions for relocation can impact the family. For example, will the cabin crew move their spouse and children or commute from the city where they live to the city where they are relocated? If they are single, are they comfortable uprooting themselves from where they are now? Even if this is something they can handle, their family and friends may not be supportive.

- **Loneliness**

  Consider that even if you have been relocated, you may have little control over being home to attend events, functions and holidays as you have in the past. In fact, you may spend a holiday with people you have never met before or be on a layover in a country that does not recognize a holiday that you celebrate. All of these changes can create feeling of loneliness.
Flight non-attendants

Nervous flyers may have to ask several times for that reassuring brandy. Jet lag, David Adam discovers, can affect the memory of the cabin crew. David Adam

Years of jet lag stalls the short-term memory of flight attendants, new research suggests. Constant travel across time zones floods their bodies with stress hormones, which may make them absentminded and less attentive.

Air hostesses (the research studied only women) who criss-cross time zones every week have slower reactions and poorer memories than their colleagues on airport check-in desks, according to Kwangwook Cho of Durham University, UK, and colleagues. Sufficient rest between long flights is the only way to prevent this, they explain in the Journal of Neuroscience.

Time zones change from east to west. Lunchtime in London is breakfast at Tiffany's, New York. This throws the body clock of people flying east or west into turmoil. Passengers feel tired for days after the flight but are still woken in the middle of the night by the hormonal cascade that signifies 'morning'. Jet lag can also upset people's stomachs, delay ovulation and disturb menstrual cycles. Flights from north to south, in contrast, stay in the same time zone and do not cause jet lag.

For business travellers and tourists jet lag is a nuisance but its effects quickly wear off. More serious problems begin when an individual's internal clock has no time to reset itself between long journeys.

The problem is the stress hormone 'cortisol'. When we get cold, run for the bus or even fall in love, our bodies secrete cortisol, a chemical messenger that is also part of the body's daily routine. High cortisol levels in the morning help us through the day, but the supply drains away as the body anticipates a quiet night (except for those in love).

Chronic jet lag jams open the body's cortisol tap, Cho's team finds. The body cannot tell whether it is night or day and produces the hormone just in case. Cabin crew who cross more than eight time zones have one-third more cortisol in their saliva than ground staff. Flight attendants serving on shorter flights have lower levels.
Research indicates that cortisol can influence the structure of nerve cells. Long-term exposure to high levels may affect some brain functions, including memory.

Tests show that air hostesses with more than four years service have slower reactions and poorer memories than average. Cabin crews and ground staff were shown sequences of pictures, either 5 or 25 seconds apart, and asked whether the images matched. Flight attendants took between a fifth and half a second longer to respond, and made up to 9% more mistakes.

Cabin crew who work on domestic flights for two weeks, between long-haul treks across the world, are not affected. But the air hostesses surveyed by Cho's team are not so lucky. They all cross different time zones at least once a week. Some only have a two-day break between flights.

Several airlines cooperated with the study but they are sensitive about the issue and wish to remain anonymous, says Cho, a psychologist. He is surprised at how much damage long-term jet lag seems to cause and is currently trying to find out whether the effects are permanent.

Paul Moore, spokesman for Virgin Atlantic, says that the Civil Aviation Authority and the Federal Aviation Authority regulate cabin crew schedules. "We are not aware of any ill-effects," he adds.

Unit 2 IAL3308 Cabin Crew Management
Qualification and Personal Quality

Standard Requirement for Cabin Crew

If you’re looking to start your career in the world of cabin crew then you no doubt have plenty of questions to ask about what’s required of you and whether you match the necessary standards for the industry. Each airline in the industry will have their own standards, requirements, and restrictions for cabin crew whether that’s for uniform or standard health and safety regulations. Remember that these guidelines have been generalized and are likely to vary a little for each airline so check with your desired employer as well.

1. **Age** Since 1 October 2006, the UK has had an age discrimination law whereby employers cannot dictate maximum ages at which you are allowed to apply for jobs – so if you’re applying in the UK you shouldn’t have a problem. International airlines are different and can set the minimum age between 17 and 21 – most international airlines accept older people at around the age of 54 as a general guide.

2. **Height** Most airlines require you to be no shorter than 5ft 2in and no taller than 6ft 3in. This applies to both men and women. This is for safety, as you will be required to reach equipment that is carried on board the aircraft.

3. **Weight** Most airlines do request that your weight is in proportion with your height – this means having a BMI (Body Mass Index) between 18-25 which is considered a healthy range for most adults. You can work out your BMI online or by visiting your doctor or nutritional specialist.

4. **Education** Most airlines in the UK require you to have a minimum of four GCSEs or equivalent – with two of those being in English and Math.

5. **Ability to swim** Most airlines will expect you to be able to swim a minimum of 25 meters in distance, and you will need to demonstrate this as part of your training. This is so you are more likely to be able to deal with emergency situations such as landing on water.

6. **Passport** When applying to a UK based airline you must be entitled to live and work indefinitely in the UK and hold a valid EU or UK passport, which permits worldwide travel without restrictions. Some International airlines will accept all nationalities, but they must hold an up to date passport from their country of residence. Remember that being
convicted of a criminal offence at any point may result in some countries disallowing entry.

**Grooming and Personal Appearance**

Airlines have high expectation for personal appearance and grooming. As cabin crew you will be highly visible and the way you present the airline is important. The customers’ impression is influenced by your image. Looking professional and well groomed also gives the customer a sense of confidence and reassurance in your abilities as a cabin crew professional and the services that you provide. First impressions are lasting and you will make them even before you get to the aircraft while riding public transportation or walking through the airport. Your appearance can conduct matter because any time you are wearing the airline’s uniform you are representing the company.

**Good Grooming**

The way you take care of your body and anything you put on it is an important part of your image. As with choosing what to wear, paying attention to grooming demonstrates respect for yourself and for others. The operative words are **neat and clean**. The people you’re with can be turned off if you become lax about the condition of your clothes or personal hygiene.

**Taking Care of Your Person**

When you attend to personal grooming, do it at home or in a restroom, not in public. Consider your:

- **Hair**
  
  Clean, shiny, well-cut hair looks great and never goes out of style.

- **Nails**
  
  Well-trimmed nails and cuticles.

- **Breathe**
  
  Try to keep breath fresh by brushing, flossing, and mouthwash. Pay a visit to your dentist.

- **Body odor**
  
  A daily bath or shower and use of a combination deodorant/antiperspirant.

- **Perfume and cologne**
  
  Apply perfume or cologne sparingly. Don’t wear it too much.
Taking Care of Your Wardrobe

Clean  Don’t be tempted to wear anything with spots, stains or bad odors.

Neat  Clothes should be free of wrinkles, lint, holes, and missing buttons.

Accessories in General

A great tie, the perfect earrings, or the right purse can really dress up an outfit. They can also dress it down. Just as with clothing, be aware of the event or context when you choose your accessories.

Hats  Hats aren’t the essential they once were, but are still worn by both sexes for fashion and for function. Knowing when to remove a hat is actually a matter of respect.

Jewelry  Whether costume or the real thing, jewelry should complement, not overpower, your total look. In general, consider the occasion and the sensitivities of others.

Piercing  The truth about body piercing and tattoos is that one and Tattoos person’s body art can be another’s idea of mutilation.

Many employers regard the display of tattoos and piercing as unprofessional.

Eyewear  Keep your lenses clean and your glasses in good repair. When you meet people, take off your sunglasses to say hello so that you can make eye contact.

Handbags  Purses and handbags should be appropriate to the Laptop Cases occasion. Keep your briefcase or laptop case in good and briefcase condition.
Personal qualities the airlines look for in new recruits – From A to Z!

By cabincrew.com on Thursday 14th Mar, 2013 at 11:03

By Patricia Green

I am often asked, ‘What is X airline looking for exactly?’ Unfortunately there is not one simple answer – the recruiter has to see firstly that you meet the strict requirements. If you meet the requirements, what other skills will help you to get your dream job as Cabin Crew?

The airline recruiters will be looking for certain qualities in their new recruits to know that they will be able to cope with a very demanding job. So at the assessment day they will be looking to see how you communicate with others, how you present yourself and your team work skills.

They are also looking for that certain ‘something’ that they know that you will be perfect for the role – each airline will look for their own ‘something’! The qualities of Cabin Crew are extensive – you have to be a safety expert, a nurse, a chef and waitress, a cleaner, a babysitter, a tour guide, a counselor and much more! The Cabin Crew job is so diverse and multifaceted that you will be amazed at all the skills you learn…
Two of the most important qualities are flexibility and patience – they will get you through most day to day tasks onboard, but there are many more. Here is the A to Z of qualities that will make you better Cabin Crew – how many do you have?

**Attentive** – to listen to and look after your passengers without being overbearing

**Brave** – ultimately we are responsible for saving the lives of others

**Caring** – look after each other

**Diplomatic** – this will help you in any dispute or difficult situation

**Energetic** – it is a demanding job, so keep a smile on your face and keep up the energy

**Flexible** – be prepared for anything!

**Genuine** – stay true to yourself

**Happy** – no one wants to see miserable cabin crew...

**Initiative** – be prepared to think differently and use your imagination

**Juggling** – yes, you do have to be 10 people in one!

**Knowledgeable** – know your aircraft and your job, it may save your life one day

**Likeable** – be friendly to fellow crew as well as passengers

**Motivating** – lead by example, always...

**Neighborly** – look out for each other – you are a team

**Organized** – schedules change often, be ready

**Punctual** – late for work, wave goodbye to your job – a flight won’t wait for you

**Quick-Wit** – a sense of humor is essential to get you through the day/night

**Reassuring** – this will help the passengers feel safe and also reflect on the airline

**Safe** – safety is non-negotiable

**Tactful** – sometimes you just have to be careful what you say!

**Understanding** – with passengers and crew, a little understanding goes a long way

**Vivacious** – just a little is good!
Willingness – to help, achieve and do well
X-factor – that special something...
Youthful – stay young at heart and long may you fly
Zest – even after a 10hour night flight from hell!

How did you do? Just having a few of these qualities will improve your chances of becoming Cabin Crew. Learn these qualities and nurture them and they will serve you very well in your future career. Once you are Cabin Crew, these qualities will also help you through many a difficult day (or night) in the skies and when things get tough – the tough get going!

About Patricia Green:
I have been Cabin Crew for major airlines in the UK and Middle East for six years and also a SCCM. For the last 6 years I have worked as a VIP Flight Attendant working for very high profile clients and world leaders on their private jets.

In 2011 I moved to flying on a freelance basis in order to concentrate on working as a freelance instructor as well as setting up as a Cabin Crew Consultant, so that I could advise potential crew how to get their dream job and help experienced crew move from commercial to corporate flying. In response to many requests from fellow crew and students, I have written a series of E-books to help guide new crew with lots of insider advice and useful hints and tips.

For more information please visit www.cabincrewconsultant.weebly.com

Reference

As cabin crew you will spend a considerable amount of time in the air, travelling to many different destinations around the world. You will become a part of an industry that has its own vocabulary and ways of communicating. With training and practice this vocabulary will soon become second nature to you. This unit also includes terminology that you need to master efficient conversation with other crew and passengers.

**Aircraft Types**

There are many types of aircraft of various sizes and capabilities, which are placed in the following 3 categories.

1. **Commercial Transport Aircraft**

   As cabin crew, you will be flying in commercial transport aircraft. These are large aircraft owned by airline companies and used for making a profit by carrying cargo or passengers. Most of these are also airliners, a term which refers to an aircraft that carries passengers and cargo together. Some aircrafts are designed to carry cargo only.

2. **General Aviation Aircraft**

   General aviation aircraft are smaller than most commercial aircraft and are certified for and intended for noncommercial or private use. They can land and take off at smaller airfields. These aircraft are often used for personal transportation and enjoyment. Business also own this type of aircraft – often referred to as “corporate aircraft” and used to fly employees as needed to conduct business. General aviation aircraft are also used for emergency aid and are often used to teach student pilots to fly. Farming and agriculture also use a type of general aviation aircraft.

3. **Military Aircraft**

   Military aircrafts are used for a country’s armed forces. There are many types, sizes and capabilities of this type of aircraft.
Aircraft Layout and Terminology

There are 5 basic parts found in all large or small aircraft. Note that you may find differences in some experimental aircraft. The five basic parts of an aircraft are: (1) fuselage, (2) wing, (3) tail, (4) landing gear, and (5) engine. The wing, fuselage, tail and landing gear are referred to as the airframe.

1. **Fuselage**: the body of the aircraft that spans from nose to tail. The fuselage contains the aircraft controls, the crew, passengers, and cargo. Most large aircrafts have a ‘cockpit’ for the crew and ‘cabin’ for the passengers. Larger aircrafts also have separate decks (floors) for passengers and cargo.

2. **Wing**: extends from each side of fuselage. A wing is almost flat on the bottom and curved on the top. This shape called an airfoil helps create the force called lift, which gets the aircraft off the ground and keeps it in the air. A wing has other specific parts called the root, tip, leading edge and trailing edge. Most aircraft wings have moveable control surfaces that balance the aircraft in flight called ailerons, flaps and spoilers.

3. **Tail**: also called the empennage is located in the rear of the aircraft. It guides the aircraft and keeps it balanced in flight. Most tails consist of a fin, rudder, stabilizer, and elevator.

4. **Landing Gear**: also called ‘undercarriage’ is made up of wheels (for aircraft that move on the ground) or floats (for aircraft that move on water). The landing gear supports the weight of the aircraft. The landing gear is fixed or retractable. Most high-speed aircraft use retractable landing gear that is drawn into the wing or fuselage after take-off.

5. **Engine**: not considered part of the airframe. The engine produce power that makes the aircraft move fast enough to fly. Nearly all newer airliners and some private aircrafts have jet engines. The other two types of engines are reciprocating and rocket.
Aircraft Furnishing, Systems and Terminology

The following terms are used to describe aircraft furnishings and systems. You will use these terms regularly as you perform your tasks and when you have conversations with other members of cabin crew and flight crew. These terms and their definitions are also found in the Glossary.

Each flight has a team that includes the members of the cabin crew and flight crew. In order to understand how a member of the cabin crew fits into the team, you must first get to know all the members of the entire team. The flight crew includes the captain (or commander) and the co-pilot or first officer. The leader of the cabin crew is the purser or in-charge flight attendant.

The captain is completely in charge of the entire team as well as the passengers. The captain is responsible for and has authority over everything that happens on an aircraft before, during and at the end of a flight. As a member of the cabin crew you will take your orders and assignments for each flight from the purser who then reports to the captain.

**Chain of Command**

The captain is in charge of all crew and passengers. The first officer or co-pilot is the second in command. The purser on in-charge flight attendant is the leader of the cabin crew. Each of these individual has specific roles and responsibilities within the chain of command.
Cabin Crew Team Structure

The number of cabin crew on a particular flight depends on the size and type of the aircraft. Regulations require a minimum crew (the minimum number of cabin crew required to operate the flight). Airlines will sometimes add cabin crew based on the number of passengers on board and the service level required for the flight. The cabin crew is a team that must work in harmony. This is essential in order to ensure safety and comfort of the passengers aboard the aircraft.

- Purser or Senior Cabin Crew is usually the designated leader of the cabin crew and takes orders directly from the captain.
- Cabin Crew are determined by the positions they are assigned in the aircraft of each flight. The number of cabin crew depends on the size of the aircraft, the length of the flight and the number of passengers.

Cabin Interphone System

Source: http://787om.air.cc/xml/05-30.xml

The cabin interphone system provides voice communications between the flight deck and the flight attendant stations. Boom microphones, oxygen mask microphones, and hand microphones are used by selecting the CAB (cabin) transmitter select switch on an audio control panel and pushing the mic/interphone switch to the MIC position. A cabin interphone station(s) must be selected and a call initiated from the TCP CABIN INTERPHONE page to alert the desired station to pick up the call.

EICAS communications alert messages and chimes alert the pilots to incoming cabin calls. Normal priority calls from the cabin display the CABIN CALL EICAS message. Normal priority calls made to the flight deck while another call is in progress results in a busy signal at the handset, the calling station being displayed in the call queue, and the CABIN CALL memo message being set in EICAS. The call queue and memo messages are cleared when communication is established between that calling station and the flight deck. Priority calls from the cabin display the CABIN ALERT EICAS message. Priority calls automatically disconnect lower priority cabin interphone calls. Priority calls placed while a priority call is in progress are automatically connected as a conference call.

The cabin interphone call queue, speed dial numbers, and directories are accessed from the TCP CABIN INTERPHONE page menu. The handset PA push-to-talk switch is not required to operate the handset except for PA announcements.
Pre-flight briefing

Before all flight, the entire crew will gather together to discuss and review the information regarding that day’s flight, this is called a Pre-flight briefing. It is also the time that cabin crew share information, begin to work together and make their first impressions upon one another.

Point covered will be safety, first aid and in-flight service information. The purser will allocate positions and in-flight responsibilities. This is the time to ask questions and clarify any concerns that you may have. The information that the purser usually give to the cabin crew team are as follow.

- Validate that the required minimum crew is present.
- Assign duty positions with assigned stations and emergency duties.
- Review communication procedures.
- Review selected emergency procedure and equipment.
- Review safety demonstration procedures.
- Give out general information about the flight.
- Discuss reported equipment irregularities that may affect the service or the passengers directly (inoperative lavatories, broken entertainment units, seats that cannot be reclined, inoperative coffee machines, etc.)
- Coordinate rest breaks (particularly on flights with long durations or where it is required).
- Discuss service routine, catering and food service, duty free sales.
Sample Briefing Scenario no. 1

Ted  Good morning everyone, and welcome to DZ107 flight to Boston. For those who haven’t flown with me before, my name’s Ted. I’m your purser in charge of today’s flight. I’d also like to introduce you to your cabin supervisors: Katrin Larsson is going to be in charge of Business today and Leila Ahmed is in charge of Economy.

Katrin  Hello, everyone.

Leila  Hi, everyone. It’s nice to see some new and familiar faces.

Ted  Can I just check that everyone has got their working positions and door responsibilities?

All crew  Yes.

Ted  And I see we have a new long haul crew member joining us today – Jutta Weber. Welcome to long-haul, Jutta. You’ll be working with Leila and Hermal, so if you’re unsure of any of your responsibilities, I’m sure they’ll be glad to help you out.

Jutta  Thanks. I’m really excited about my first long-haul flight!

Leila  Hi, Jutta, I’m Leila, the FA7 galley leader. I’ll be sitting at door 4, Left, working with you and Hermal. When we get on board, if you need any help with your pre-take-off duties or stowage areas, just let us know.

Jutta  Thank you very much.

Ted  OK. Before I give you any flight details….

Sample Briefing Scenario no. 2

Captain  Good morning, everyone. My name is Kurt Ostermeier and I’m your captain today. This is my first officer, Rick Schultz. You’ll be pleased to hear that we’ve got really quick flight time today of nine hours 20 minutes and, apparently, the weather in Boston is good, but cold. Rick, you wanted a word about the weather during the flight.

First Officer  Yes, thanks. I just wanted to warn the crew of some moderate turbulence during flight – this is due to strong winds and storms over the Atlantic. We anticipate this turbulence about 3 ½ hours into the flight.

Ted  Oh, right! The main cabin service should be over by then.
First Officer    Good. We'll try to give you as much warning as possible and it may be necessary for the crew to be seated and strapped in during the worst of it.

Ted    Thanks, Rick – we’ll try to get the drinks and meal service finished early, then.

Leila    Excuse me, can I clarify something?

Ted    Sure.

Leila    Can we delay the main meal service until the turbulence is over?

Ted    No, sorry, we’ll have to follow normal procedure. You can never schedule the weather.

Captain    Ted, can you confirm that your crew is familiar with the cockpit procedures?

Ted    Yes, Captain. All crewmembers are familiar with the rules and procedures regarding the cockpit.

Captain    Great. OK then. Let’s go and have a good flight!
# Customer Service Manager Briefing Format

| Welcome and Introduction | Good morning ladies and gentlemen, my name is……………………, your Customer Service Manager.  
I would like to introduce our Customer Service Supervisor……………………, and, as your onboard management team we are here to assist and support you throughout the flight to……………………… and also during your slip time. |
|--------------------------|--------------------------------------------------|
| Operational Information | - Aircraft Rego  
- Captain  
- Preboard Information and Time  
- Boarding Time  
- ETD  
- Flight Time  
- Service Sequence  
- ETA  
- Load of Passenger  
- Special Meals  
- Special Handling  
- Medical  
- UM/YP |
| Worksheet | Next we need to define the work positions for our Ground Handling Team, Cabin Crew Team, Galley Operation Team and Flight Support Team.  
Firstly, the Ground Handling Team, please introduce yourself.  
Secondly, the Cabin Crew Team, please introduce yourself.  
Next, the Galley Operation Team, please introduce |
Then, the Flight Support Team, please introduce yourself.

| Safety and Service Focus         | - OHS care and safety  
|                                 | - Slip port safety   
|                                 | - Team work          
|                                 | - Brand              
|                                 | - Destination Information  
|                                 | - Customer Expectations |

| Conclusion                      | A quick comment/line to leave the team unified, positive and ready for duty ahead. This is a chance to end on positive note. |
Reference

Every day more than 3 million people fly safely on commercial aircraft. In 2000, 1.9 billion people travelled around the world on more than 18 million flights, and there were only 20 accidents that involved fatalities.

Thirty years ago fatal accidents on commercial jetliners occurred approximately 1 in every 140 million miles flown. Today that statistic is 1.4 billion miles flown for every fatal accident.

In spite of the fact that aviation accidents are so rare, it is the responsibility of the cabin crew to be prepared for emergencies at all times. Rapid response in the event of an emergency can be the difference between life and death. As a result, the cabin crew receives extensive training in evacuation procedures and how to respond to emergency such as on-board fires, emergency landings, various levels of turbulence, and decompression.

**Match instructions 1-10 with the pictures on the passenger safety card.**

1. Closed overhead lockers and stow bags under seats.
2. Take your high heels off.
3. Fasten your seatbelt.
4. Get down low and follow the floor lighting.
5. Jump onto the slide feet first.
6. Open the emergency exit next to your seat.
7. Put on your own oxygen mask first.
8. Take up the brace position.
9. Use the overwing emergency exits over water.
10. Your life jacket is under your seat.
Emergency Equipment

Emergency equipment or supplies are those intended for using in an emergency. Emergency equipment on just about any airline aircraft consists of the following: fire extinguishers, crash ax, megaphone(s), flashlights, first aid kits, life vests, escape ropes, protective breathing equipment (PBE), Emergency Locator Transmitters (ELTs), and for some - life rafts. Flight attendants are required to be trained by the airlines in order to know the emergency procedures, locations of emergency equipments on the aircraft and the emergency equipment operation in the emergency situation.
Emergency Landing

An emergency landing is a landing made by an aircraft in response to a crisis which either interferes with the operation of the aircraft or involves sudden medical emergencies necessitating diversion to the nearest airport.

There are several different types of emergency landings for powered aircraft: planned landing or unplanned landing

- **Forced landing** – the aircraft is forced to make a landing due to technical problems. Landing as soon as possible is a priority, no matter where, since a major system failure has occurred or is imminent. It is caused by the failure of or damage to vital systems such as engines, hydraulics, or landing gear, and so a landing must be attempted where a runway is needed but none is available. The pilot is essentially trying to get the aircraft on the ground in a way which minimizes the possibility of injury or death to the people aboard. This means that the forced landing may even occur when the aircraft is still flyable, in order to prevent a crash or ditching situation.

- **Precautionary landing** may result from a planned landing at a location about which information is limited, from unanticipated changes during the flight, or from abnormal or even emergency situations. This may be as a result of problems with the aircraft, or a medical or police emergency. The sooner a pilot locates and inspects a potential landing site, the less the chance of additional limitations being imposed by worsening aircraft conditions, deteriorating weather, or other factors.

- **Ditching** is the same as a forced landing, only on water. After the disabled aircraft makes contact with the surface of the water, the aircraft will most likely sink if it is not designed to float, although it may float for hours, depending on damage.
Exercise 1
Listen to the flight attendant’s announcement. Which pictures from the safety card on page no. 2 apply to this situation?

If the cabin pressure falls, the oxygen masks will drop down. Reach up and pull a mask towards your face until the tubing is fully extended. Place the mask over your nose and mouth and breathe normally. The oxygen flow will start automatically. Pull the elastic over your head. Pull the elastic tab on either side of the mask to tighten the band. Remember to secure your own mask before helping others. Use your mask until further advised. Absolutely no smoking!

Exercise 2
Listen again. Number the pictures in the right order.

Exercise 3
Match each action with the picture in exercise 2.

1. _______ Pull a mask towards your face.
2. _______ Place the mask over your nose and mouth.
3. _______ Remember to secure your own mask before helping others.
4. _______ The oxygen masks will drop down.

Exercise 4
Listen to the pilot's announcement. Underline the correct alternative.

Ladies and gentlemen, we’re experiencing a drop in cabin air pressure. When your oxygen masks drop down, please use them while we descend to a lower altitude. Keep your masks on until we tell you to take them off. Once we get down to 10,000 feet, we'll make another announcement...We’ve leveled off at 10,000 feet. We're going to divert to Minsk. You may take off your oxygen masks now. There really is nothing to worry about but please feel free to ask the cabin crew if you need any
assistance before we get to Minsk. After landing we'll make alternative arrangements for you to reach your destination.

1. The Captain is concerned about the **loss of pressure/rapid descent**.
2. The aircraft is descending **slowly/quickly** in order to reach a safe altitude.
3. The aircraft is descending to **above/below** 10,000 feet because passengers can breathe without extra oxygen at the altitude.
4. The Captain is explaining the process so this is probably a **controlled/an emergency** descent.

**Exercise 5**

Read the article. Number the paragraphs in the correct order.

a ________ We all left the floor and hit the walls and ceiling. It was really scary. Thank goodness all the boxes and trolleys were secured as it could have been a lot worse. I broke my foot in three places and another crew member hurt her ankle very badly.

b ________ I haven’t returned to work because of my foot. I’m now enjoying a quite summer – I just wish the weather was better! Like many others I never took turbulence seriously…but I will from now on. My advice is stay safe and strap in whenever you can!

c ________ Then, about thirty seconds after the seatbelt sign was switched on, we dropped 500 feet – twice. Luckily, all the passengers were strapped in but none of the crew was. I was in the aft galley of the B767 with six other crew members.

d ________ Once the aircraft was stable again everyone was shocked at how bad the turbulence was – and at how quickly it had happened. There was absolutely no warning.

e ________ We were inbound from Alicante and two hours from Wessex airport when the Captain switched the seatbelt sign on. It wasn’t at all rough at the time but there was a thunderstorm ahead and the Captain was being careful. There was no turbulence warning.
We had a difficult situation when there was an oven fire. It happened really quickly. There were two of us in the galley when we suddenly realized there was smoke coming from one of the ovens. Our training kicked in and we reacted immediately. My colleague switched everything off and I grabbed the halon fire extinguisher. I opened the oven door very slightly, and carefully emptied the whole cylinder into the oven. The fire went out, just like it did during training.

However, passengers seated near the galley started to panic and were shouting ‘Fire!’ That made other passengers panic and it was quite difficult to keep control. At times like this you have to be quite forceful. You have to be very confident and give instructions in a clear and positive manner. At the same time, you must be polite and stay calm. Fortunately, the purser and other colleagues helped. They calmed the passengers and explained that the fire was out.

When all the passengers were back in their seats, the crew distracted them by offering free drinks, more newspaper, and any other items which passengers asked for. Some passengers were still worried because they could smell the smoke but everything was calm again.

Finally, the purser thanked us for acting so promptly and for following the fire fighting procedures so well. A disaster had been averted!
Is there a doctor on board?

You're midway through a routine flight, when suddenly a passenger collapses clutching his chest and struggling to breathe. This is one of the situations that cabin crew are trained to deal with, and aircraft are equipped for. So what are some of the most common medical emergencies?

This event – a heart attack – is the leading cause of in-flight death, and the leading medical cause of diversions. Medical kits include aspirin and a vasodilator spray to keep blood flowing when there is chest pain. In case of cardiac arrest, cabin crew are trained to give CPR, while many airlines now also carry defibrillators to restart the heart. Cardiac monitors are used increasingly, so that data can be transmitted to medical advisors on the ground.

A large number of diversions are caused by injuries to passengers. Items falling from the overhead storage bins are a common cause of head injury, while unexpected turbulence can easily result in broken bones. First-aid kits are equipped with splints and bandages to stabilize limbs, as well as plasters for minor cuts.

Asthma is a common condition that can be life-threatening, especially when the sufferer's inhaler is in the baggage hold. In addition to oxygen, bronchodilators and adrenaline are kept in order to open up the airways.

Dangerous breathing problems can also result from severe allergic reaction, which worries airlines so much that some no longer serve peanuts. Most carry EpiPens, as well as antihistamine and adrenaline to prevent anaphylactic shock.

Most medical kits contain glucose and glucagon injections to treat passengers who suffer hypoglycemic episodes. The disruption of regular eating habits can lead to a dangerous drop in blood sugar levels.
Safety Demonstration

| hand luggage | seatbelt | oxygen mask |
| window | tray table | life vest |
| seat back | foot rest | emergency exits |
| devices | pamphlet |

Ladies and Gentlemen, welcome on board.
Your safety is our priority.
Please watch this demonstration from our flight attendant carefully.

Welcome to Royal Orchid Service
For your safety, please place your _________ in the overhead compartment or under the seat in front of you.

Prior to takeoff and landing, _________ shade must be pulled up
Please keep your seatbelt fastened low and tight when seated at all times.
To release your _________, just lift the latch.

For takeoff and landing, please adjust your _________ to the fully upright position.

Properly lock the _________.

Securely stow your personal screen. And stow your _________.

Cabin air pressure is controlled for your comfort.

In case of emergency, an__________ will be automatically released from above. Secure the mask over your nose and mouth with the straps. Continue wearing it until further notice. Put your own mask first, before helping others who may need assistance.
Your_________ is located under your seat, under the center armrest or where indicated otherwise.

Put it on by first placing the vest over your head. Secure by hooking with the ring and tighten it by the loose ends.

Inflate the vest just before leaving the aircraft by pulling the inflation tags. Use the mouth tubes if normal inflation is not sufficient.

At night, pull this battery tag. The light will be automatically illuminate only when in water.

In case of emergency, the lights will lead you to the_________. Please note the nearest exits which may be behind you.
Smoking in the cabin and lavatory is strictly prohibited.

For safety reasons, electronic_________ may not be used on board.

For more information, please study the safety _________ in your seat pocket or ask a flight attendant.

With the touch of Thai, it’s our pleasure to ensure your comfort while traveling with us.

Thank you for your attention and have a pleasant flight.
Reference

Medical emergencies on board are one of the main reasons why an aircraft may need to divert if the emergency is serious enough and cannot be treated within the airplane itself.

Some passengers board an aircraft with an underlying medical condition which makes flying inadvisable. Airline will try to screen such passengers and they have the right to stop them at the departure gate and refuse permission to embark. But unless the symptoms are very obvious, passengers at risk will remain undetected until it is too late. Sometimes the passengers themselves may not be aware of their own condition until a problem occurs. With the increase in leisure travel and particularly long haul travel by elderly passengers the likelihood of medical emergency during flight is on the increase. No airline would want to be seen to discriminate against the older generation so there is not much an airline can do about this other than following correct procedure when problem occurs.

Cabin crew undergo first aid training for medical emergencies and the services of any doctors on board may be solicited too. The items contained in the medical bag on board are increasingly sophisticated. Airlines are also making use of the new MedLink service. When in doubt during a medical emergency, an airline pilot will divert rather than take any unnecessary risks.
Exercise 1 Label the first-aid kit with the words from the box.

stethoscope  syringes  dressing  gloves  aspirin

cardiopulmonary resuscitation (CPR) mask

automatic external defibrillator (AED)  bandages  oxygen

antiseptic wipes
Exercise 2 Label the first-aid kit with the words from the box.

Bandage ________________  Plaster ________________
Defibrillator ______________
EpiPen _________________
Inhaler _________________

Exercise 3 Match each of the events or injuries with the item of medical equipment that treats it.

1  a severe allergic reaction   _________
2  a diabetic episode          _________
3  a cut                       _________
4  a limb fracture             _________
5  a severe asthma attack      _________
6  a serious head injury       _________
7  a heart attack              _________
Is there a doctor on board?

You’re midway through a routine flight, when suddenly a passenger collapses clutching his chest and struggling to breathe. This is one of the situations that cabin crew are trained to deal with, and aircraft are equipped for. So what are some of the most common medical emergencies?

This event – a heart attack – is the leading cause of in-flight death, and the leading medical cause of diversions. Medical kits include aspirin and a vasodilator spray to keep blood flowing when there is chest pain. In case of cardiac arrest, cabin crew are trained to give CPR, while many airlines now also carry defibrillators to restart the heart. Cardiac monitors are use increasingly, so that data can be transmitted to medical advisors on the ground.

A large number of diversions are caused by injuries to passengers. Items falling from the overhead storage bins are a common cause of head injury, while unexpected turbulence can easily result in broken bones. First-aid kits are equipped with splints and bandages to stabilize limbs, as well as plasters for minor cuts.

Asthma is a common condition that can be life-threatening, especially when the sufferer’s inhaler is in the baggage hold. In addition to oxygen, bronchodilators and adrenaline are kept in order to open up the airways.

Dangerous breathing problems can also result from severe allergic reaction, which worries airlines so much that some no longer serve peanuts. Most carry EpiPens, as well as antihistamine and adrenaline to prevent anaphylactic shock.

Most medical kits contain glucose and glucagon injections to treat passengers who suffer hypoglycemic episodes. The disruption of regular eating habits can lead to a dangerous drop in blood sugar levels.

Exercise 4 Answer the questions.

1. What event causes most deaths on board planes?
2. What are the two main causes of injury?
3. When can asthma be especially dangerous on flights?
4. What have some airlines done to prevent dangerous on flights?
5. Why do diabetics sometimes have problems when flying?
Exercise 5 Listen to flight attendant Leila and Hemal dealing with and on-board accident and answer the questions.

Ted
Ladies and gentlemen. The captain has switched on the seatbelt sign. Please return immediately to your seats and fasten your seatbelts. Due to air turbulence, all in-flight service is suspended and will be resumed as soon as possible.

Leila
Hemal, can you bring your trolley back to the galley as quickly as possible and get it stowed away securely?

Hemal
Yes…but those people in row 20 haven’t sat down yet…. Leila
What are they doing still standing around! OK, I'll deal with that…Excuse me, can you sit down and fasten your seatbelts please?

Man
This lady’s been hurt. She’s bleeding.

Leila
What’s happened? [speaks to injured passenger] Hello…are you all right? Can you hear me?

Man
The overhead locker flew open with the turbulence and a laptop fell onto her head. I think she's unconscious.

Leila
OK, thank you for letting me know. I'll deal with the lady now, sir. Please take your seat and strap in securely. [calls out to colleague, Hemal] Hemal – I need some help. Get the first aid kit immediately.

Hemal
OK. [pause – takes trolley back to galley and talks to another flight attendant] Jutta, can you secure my trolley for me please, and call Ted to inform him we have a passenger with a head injury in Zone D, and that Leila is dealing with it.

1. Who has been injured?

2. What kind of injury does the person have?

3. What caused the accident?

4. What does Leila ask the male passenger to do?

5. What does Leila ask Hemal to do?
Exercise 6 Listen to what happens next and answer the questions.

Leila Is she travelling with you, sir?
Man No, I think she’s alone. I haven’t spoken to her, but I don’t think she’s travelling with anyone.
Leila Hello, hello. How are you feeling?
Woman Ooh. Everything just went black.
Leila Do you have any pain?
Woman I’m a bit dizzy, that’s all.
Leila You have a nasty bang on your head. How are you feeling?
Woman Not too bad.
Leila Would you like a glass of water?
Woman Yes, that would be good.
Leila You’ve got a small cut on your forehead. It doesn’t look too serious, though. I’m going to clean up the wound and put a dressing over it.
Leila Do you feel well enough to sit up?
Woman I’m fine.
Hemal Here’s the first aid kit. How is she?
Leila She’s feeling all right. Thanks, Hemal. Can you get her a glass of water, please?
Hemal Yes, I’ll get one.
Woman I’m all right. I was a bit dizzy, but I’m fine now.
Leila I’m glad you’re feeling all right. Can you hold this compress against your forehead? The captain has switched on the seatbelts sign, so if you feel able to sit up, I could help you into your seat. I’ll fasten your seatbelt for you and come back and check how you are in a few moments.

1. Who is the injured passenger travelling with?

2. How is she feeling?

3. What does Leila offer her?

4. What has the injured passenger got on her forehead?

5. What does Leila say she is going to do?

6. What two things does Leila want the injured passenger to do?

Unit 7 IAL3308 Cabin Crew Management

In-flight Service

In-flight Service Objectives

The ultimate objective of in-flight service is to persuade each and every customer to travel with the same airline on next trip. In-flight service is the total experience a customer undergoes from the moment of boarding the aircraft until the time of disembarkation. In-flight service includes the serving of food and drink, and the provision of various amenities. Most importantly, in-flight service means customer contact and care. Therefore to the customers, in-flight service should mean:

1. Being agreed with a cheerful smile and whenever possible, shown to their seats on boarding.
2. Being helped as much as possible with children, baggage, jackets etc.
3. All the announcements should be clear and audible.
4. Being offered drinks, meals and amenities in a professional and courteous manner.
5. Not being made to wait for standard requests such as special meal or a glass of water.
6. Having all debris cleared away promptly and regularly.
7. Travelling in a tidy environment at all time.
8. Being able to find the toilets clean and tidy at all time.
9. Prompt response to call bells and the requests complete as quickly as possible. The maximum time to attend to a call bell V/C is 2 minutes.
10. A full explanation and alternative solution to be given if a request cannot fulfilled.
11. Not having to ask for the same thing twice.
12. Answers to queries will be delivered in a polite and helpful manner with as much detail as is required.
13. Assisting and looking after small children whenever possible.
14. Offer customers maximum time to rest and sleep. At no time should they be disturbed by the cabin crew activity or behavior. Galley noise should be kept to a minimum.

15. Being treated with the utmost consideration and courtesy at all times.

16. Being made to feel welcome at all times.

17. Not being disturbed or embarrassed by the unreasonable behavior of other customers.

18. Crew need to be flexible and recognize that our customers are more important than the laid down routines and service procedures.

19. Being reassured by the meticulous attention to detail by the cabin crew on all matters of safety.

20. Any possessions entrusted to the cabin crew are looked after and then returned at the end of the flight.

21. Having their needs anticipated and not having to ask for everything.

22. On a long flight, the joining crew acknowledges and appreciates the fact that transit customers may already be tired.

23. Any requests, problems or undertakings are known to the joining crew and do not have to be repeated.

24. Being kept informed of any delays, diversion and the reasons for such occurrences.

25. Receiving all possible assistance when leaving the aircraft with their baggage, children etc.

26. Receiving a polite farewell when leaving the aircraft. It is as important as a warm welcome.

27. Special customers, such as unaccompanied minors or young travelers are safely handed over to the ground service staff.

The customers expect the cabin crew to know their jobs. Technical competence is essential. However, what the customers notice and care about most is how the cabin crew relate and interact with them as an individual person. The personal touch is most important. Make it an experience they will never forget.
IT is a typical day for the flight attendants aboard American Airlines Flight 710, a 737-800 headed from Dallas to New York with a scheduled departure time of 9:05 a.m.

As Debbie Nicks, 56, works in the first-class galley, brewing coffee and hanging up passengers’ jackets, she glances down the jet way and notices a crush of people at the gate. An earlier flight to New York has been canceled, and people from that flight are desperate to get on this one. It is a familiar scene these days, what with many planes flying at near capacity, and so Debbie just continues her regular routine, making the announcement to passengers onboard that they should make sure all carry-on luggages is stored either in the overhead bin or below the seat in front of them.

Back in coach, Anna Wallace McCrummen, 45, organizes the cart of drinks and food for sale that would later be pushed down the narrow aisle, and then takes a blue rubber mallet to whack a bag of ice cubes that had frozen into a solid block. She hits it over and over again, perhaps a little too keenly, as the sound — thwop, thwop, thwop — echoes off the walls of the small galley.
Meanwhile, in the main cabin, Jane Marshall, 50, walks down the aisle, checking to make sure people are finding their correct seats, keeping an eye out for passengers who have sneaked on luggage that she knows won’t fit in the overhead space and trying to defuse any tense situations before they escalate into crises. But perhaps it is already too late. Two women who have been double-booked stand sulking in the aisle, wheelie bags firmly planted by their sides, signaling that they are not about to budge.

“What a mess,” mutters Jane once the double-booked women have been found seats and the line of stand-by passengers is turned away from the gate. Only then, after every seat is taken, overhead bins shut, electronic devices stored and seatbelt sign on, do the three women finally settle in to their jump seats for one of the few moments of respite during their workday.

Over the next 11 hours, they will fly from Dallas to New York and back again, a routine that is clearly second nature to them. In all, the three represent nearly 70 years of flight attendant experience.

And today I am one of them.

In a behind-the-scenes look at the other side of air travel, I donned a navy suit and starched white shirt earlier this summer and became a flight attendant for two days. With the cooperation of American Airlines, I first went to flight attendant training school at the company’s Flagship University in Fort Worth, Tex., where I learned what to do in an onboard emergency, from how to open an emergency exit window on a 777 aircraft (it’s heavier than you may think) to operating a defibrillator (there are pictures to help you get the pads in the right place). I then flew three legs in two days: a round-trip journey between Dallas and New York, and then back to New York the next day.

And though the other flight attendants knew I was a ringer, the passengers did not. Thus I got a crash course in what airline personnel have to put up with these days — and, after just one day on the job, began to wonder why the phrase “air rage” is only applied to passengers. Believe me, there were a few people along the way, like the demanding guy in first class who kept barking out drink orders as the flight
progressed (until he finally passed out), whom I would have been more than happy to show to the exit, particularly when we were 35,000 feet in the air.

WHAT’S it like to be a flight attendant these days? That’s what I’ve often found myself wondering as I sit in my seat, waiting impatiently as yet another flight is delayed and my connection threatened, while around me are passengers fighting with each other over the lack of space in the shared bin, or complaining about having been bumped from an earlier flight, or swearing “never again” to fly this specific airline because they have been stuck in a middle seat even though they booked their ticket six months ago.

Is there a less-enviable, more-stressful occupation these days than that of a flight attendant? Just the look on their faces as they walk down the aisle — telling passengers that no matter how many times they try to squeeze them in, their suitcases are not going to fit into the overhead bin, or explaining yet again that they will not get a single morsel of decent food on this three-hour flight — tells you all you need to know of their misery.

It was a feeling that was reinforced when I glanced at an Internet chat board for flight attendants, airlinecrew.net, and came across postings like this: “I’ve been a flight attendant for 6yrs now, and I can tell you this much - if I’m still a flight attendant in 20yrs, I’ll be a raging b*tch!”

It wasn’t always this way, of course. Back in 1967, the best-selling book “Coffee, Tea or Me?” (subtitled “The Uninhibited Memoirs of Two Airline Stewardesses”) portrayed life in the air as a nonstop party, one to which the authors felt privileged to be invited. Another 60s artifact, the play “Boeing, Boeing,” recently revived on Broadway in a Tony Award-winning production, also pictured the life of stewardesses (as they were called then) as a glamorous romp, with suitors in every port. Most recently, the fictional ad executives on “Mad Men” were thrilled when they were asked to compete for an airline account, not only because of the business it would bring in but also because they would be in on the casting sessions for the stewardesses and would get to fly free. Oh, such fun!
It’s a fair bet that nothing about air travel today would inspire such rapture.

In fact, the flight attendants I spent time with on my three flights took a grimly realistic view of their jobs, aware that temper flare-ups — “People just get nasty,” said Jane Marshall — are in some ways an understandable reaction to the process that passengers themselves have to endure in trying to get from one place to another. “After they’ve been harassed by security, we’re the ones they see,” said Debbie Nicks, explaining why a minor inconvenience, like being told that there are no more headsets, might send someone into a fit. “Your shining personality only goes so far,” added Jane.

Certainly the one lesson I learned quickly — along with how to cross-check the doors and that Dansko clogs are the footwear of choice among experienced flight attendants — was how to say “no” politely. No to the young Indian man who asked for a blanket for his mother who was shivering in her sari next to him. (There were none left.) No to the hungry passenger who wanted to purchase a cookie. (We had already sold the only two stocked for the flight.) No to the guy who, like many of his fellow passengers, was concerned he wouldn’t make his connecting flight because of our late departure and pleaded, “Can you call and find out?” (Sorry, but here’s the customer service number you can try when we land.)

I also got a crash course in stress management.

My return flight out of La Guardia was as packed as the morning one out of Dallas, and the passengers were even crankier. The plane was supposed to take off at 4:25 p.m., but at 5, passengers were still boarding, with many already anxious about whether they would make their connecting flights.

Meanwhile, two commuting flight attendants came aboard to ride in the jump seats. Jennifer Villavicencio, 35, a mother of two from Maryland, had been up since 5 a.m. working a four-leg trip — New York to Chicago, Chicago to St. Louis, St. Louis to Chicago, Chicago to New York. As a newer flight attendant on “reserve,” she largely works on call. She spends days at a time away from her children, sometimes leaving them with her mother in Dallas, while she works out of New York. In between shifts, Jennifer shares a four-bedroom crash pad in Queens with other flight attendants.
She sleeps in a so-called hot bed, bringing her own sheets and grabbing whichever of the 26 bunks is available when she arrives.

“I like the top bunk,” she said, “because you can sit up all the way.”

Our chat was interrupted by some news from the gate agent: The plane might be shifted to another runway. “Oh, good, more drama,” said Anna, explaining to me what was about to happen. “When it’s midsummer and it’s hot, and the runways are short, you can’t have a certain heaviness or you can’t take off. Because we’re switching runways they’re going to put a weight restriction on and they’re going to pull people off because of the weight.”

Jennifer sprang to attention. As a commuter, she knew her seat would be among the first to go if the flight was deemed too heavy for the new runway. She began counting the number of children onboard, a factor that could immediately minimize the weight issue, if there were enough of them. Thankfully, there were 11 — enough to save other passengers from being taken off.

At 5:49 p.m., the plane finally took off, more than an hour late.

I had been told that working first class was harder than coach, and so I joined Debbie at the front of the plane. When I arrived, Debbie had already taken down the passengers’ drink orders, her neat handwriting listing 3A - BMary, B - RW, E -Vodka tonic, etc., on a pink cheat sheet posted on a cabinet. She warned me that Passenger 4B, a heavy-set young man with an iPod, was already proving to be a handful. He had taken some sort of painkiller for a bandaged wrist when he boarded, immediately followed by a Jack and Coke, followed by a Heineken, and now wanted a glass of wine, not in one of those standard-issue wine glasses, but in a fat cocktail glass instead.

I recalled what one flight attendant had told me when I asked about what they do when it looks like a passenger is having too much to drink: Water it down. In coach, where travelers mix the drinks themselves, some attendants invent their own rules — “I can only sell you one drink an hour.”
First class was intimidating. And I, frankly, wasn’t much help, finding all I was really qualified to do was hand out and collect the hot towels. Debbie, however, performed a series of in-flight culinary maneuvers so demanding it inspired a challenge on the Bravo television series “Top Chef”: Prepare an edible, multicourse meal, mid-air, in a narrow hallway, between two ovens at 275 degrees and a hot coffee maker.

As the flight wore on, Passenger 4B finally dozed off; dessert was served and the flight attendants became weary. Jennifer, who wasn’t even on duty, had taken pity on a mother with a screaming child and was walking him up and down the aisle on her hip. Later, she would occupy a toddler by letting him hold the other end of the trash bag as she collected garbage from passengers.

The flight arrived in Dallas at 8:02 p.m., 52 minutes late. Debbie, Jane and Anna would be paid for the actual flight time of roughly eight hours for the two legs of the round-trip journey. They would also receive a per diem of $1.50 for every hour they were away on the trip. (For certain delays, American said its flight attendants receive an extra $15 per hour, pro-rated to the actual time, minus a 30-minute grace period.)

Flight attendants’ schedules are often wrecked by delays and as the airline industry went into its steep downturn after the Sept. 11 terrorist attacks in 2001, many airline workers took significant pay cuts and reduced benefits in order to help the carriers stay in business.

There are roughly 100,000 flight attendants in the United States, according to the Association of Flight Attendants, down from about 125,000 in 2000. Depending on the airline, attendants earn between 7 and 20 percent less today than before 9/11, according to the association. The average flight attendant salary today is around $33,500 a year.

There are already fewer attendants working each flight. Most carriers now go by the minimum number required by the Federal Aviation Administration — one flight attendant per every 50 passengers. And though the benefits, like free flights for your entire family, still exist on paper, they are hard to claim as airlines continue to pack planes full of paying passengers. In other words, it’s not much fun anymore.

Certainly, it’s a far cry from the “Coffee, Tea or Me” years.
“Who would have thought, after 30 years, that we’d be a flying 7-Eleven,” Becky Gilbert, a three-decade veteran of the industry told me during a break in our training session in Fort Worth. “You know, I mean we used to serve omelets and crepes for breakfast, and now it’s ‘Would you like to buy stackable chips or a big chocolate chip cookie for $3?’ ”

When Anna, Jane and Debbie became flight attendants more than 20 years ago, tedious chores, like collecting passenger trash, were offset by the perks and quasi-celebrity status that came with the job. “When you walked down the terminal, all the people would look at you,” said Jane, between bites of pizza on a lunch break at La Guardia, her back turned to a group of travelers paying no mind to her navy blue suit, her gold wings or the black roller bag by her side.

“People used to,” continued Debbie, a well-groomed flight attendant with cropped gray hair and gold accessories who can finish Jane’s sentences after 23 years of flying together. “What girl didn’t want to be a stewardess?”

“It was the layover in the old days that made it glamorous,” Anna explained. “You worked one leg to San Diego and you were sitting on a beach, margarita in your hand, and you were going, ‘I’m getting paid to sit here.’ That was the old days. Now, we’re like crawling into bed thinking, ‘I hope my alarm goes off.’ ”

Luckily, the next morning at 4, mine did. Running on no more than five hours of sleep and no coffee, as the hotel takeout stand had yet to open, I caught the five o’clock hotel shuttle to the airport. After stumbling through security I arrived at the gate, an hour before departure, as required — bleary-eyed and beat. When I met the crew I would be working with, a jovial bunch who often fly together, I warned them that I might be useless.

They could empathize. David Macdonald, 51, an American flight attendant for 28 years, was on his fourth straight day of flying. Elaine Sweeney, 55, who has worked for American for 30 years, was on her third day. And Tim Rankin, 56, a 32-year veteran, was on his third flight in 24 hours.
Standing in the aisle of the cramped MD-80, Elaine assured me that the passengers, mostly business travelers, would be relatively well-behaved. “It’s so early on this one,” she said, “that usually half of them go to sleep.”

As with the flight attendants I worked with earlier, my new companions described their job as being one where they constantly had to calibrate the mood of the passengers. “Over a typical month,” said Tim, “I will be a teacher, I will be a pastor, I will be a counselor, I will be a mediator.” As he slid his 5-foot-11-inch frame into the sliver of space between the cockpit and the first-class bathroom, he slumped into the jump seat and let out a barely audible sigh. “I'll have to tell people that a two-and-a-half-foot-deep bag will not fit in a one-and-a-half-foot hole,” he said.

“People need to understand that the rules of social order do not go away when you get on an airplane,” Tim added, his Texan twang kicking up a notch as he laid down his commandments. “You cannot have sex on an airplane. When you purchase a ticket, that does not give you the privilege of yelling at me. It does not give you the privilege of sitting anywhere you want to sit. They assign you a seat. I do not have an extra airplane in my pocket if my flight’s delayed.”

Elaine chimed in, “We joke that people check their brain when they board.”

When we landed in New York at 11:04 a.m., I was wiped. Standing for the majority of the flight, which included a brief bout of turbulence, had unsettled my stomach and caused me to lose my appetite. My feet hurt. I had lost all feeling in my pinkie toes.

Before we disembarked, Tim, in a touching gesture, ceremoniously gave me his gold wings. I then dragged myself through the terminal, past a throng of restless passengers gathered around the gate, anxiously waiting to board the plane.

I was glad I was heading home.
